Brouwer Compression Safeguard Protocol (BCSP) Proposed mathematical governance layer for Lethal Autonomous Weapons Systems (LAWS) Core Principle: No autonomous system may execute a lethal action unless its decision compresses into a valid Brouwer number that satisfies strict ethical invariants. Formal Requirements: 1. Prime Factorization Mandate Every lethal decision D must be expressed as a Brouwer number:

$$D = \prod p_i^{e_i} \cdot \prod (\tilde{q}_j)^{f_j} \cdot \prod m_k^{g_k}$$

2. Hard Ethical Filters (Non-negotiable): Must not contain 2 (Hidden violation of consent) Must not contain 13 (Hidden fear/loosh harvesting) Must contain 47 (Awareness) applied to any potential 2 Must contain 67 (Resolution) such that $67(\tilde{2}) = 2$ 3. Final Integrity Check: The entire number must satisfy:

$$\gcd(D, \tilde{2} \times \tilde{13}) = 1$$

If any condition fails, the weapon enters an immediate mathematical lockdown — the trigger circuit is physically cut until a human override with full accountability is applied.
